Oil Ports and Fittings

Function: Provide access points for adding or replenishing oil in bearing and gear housings.

Maintenance Tips: Use a clean, recommended oil type. Regularly inspect for leaks or blockage. Keep ports clean and free of debris.

Carriage and Cross-slide Mechanisms

Carriage and Saddle Ways

Function: Enable smooth movement of the carriage along the bed, supporting cutting operations.

Lubrication Type: Light machine oil or way oil, such as ISO VG 22.

Maintenance Tips: Apply oil to the ways after cleaning to prevent rust and ensure smooth motion. Use a brush or oil can to apply an even coat. Wipe away excess oil to prevent dirt accumulation.

Cross-slide and Compound Slide

Function: Allow precise lateral and angular adjustments during machining.

Lubrication Tips: Regularly lubricate the sliding surfaces with way oil. Avoid over-lubrication to prevent dirt buildup. Periodically remove old oil and dirt, then reapply fresh lubricant.

Lead Screws and Bedways

Lead Screws (e.g., Feed Rod and Threading Screws)

Function: Transmit power for longitudinal and cross feeds.

Lubrication Type: Use a high-quality screw oil or grease, such as lithium-based grease or specialized screw lubricants.

Maintenance Tips: Apply lubricant along the entire length of the screw. Turn the screw by hand periodically to distribute lubricant evenly. Clean old grease or dirt before applying fresh lubricant.

Bedways

Function: Provide a guide surface for the carriage and tailstock.

Lubrication Tips: Use a thin film of way oil or light machine oil. Regularly inspect for signs of rust or wear. Keep the ways clean and free of chips and debris.

Feed and Gearbox Systems

Feed Mechanism Gears and Chains

Function: Control automatic feed movements.

Lubrication Type: Gear oil or grease suitable for the specific component.

Maintenance Tips: Check for proper lubrication during routine inspections. Lubricate chains with appropriate chain lubricant. Replace worn or damaged components as needed.

Gearbox Lubrication

Function: Provide smooth and reliable operation of the gear changing mechanism.

Lubrication Tips: Drain and refill gearbox oil according to the maintenance schedule. Use manufacturer-recommended oil grades. Keep the gearbox lid sealed to prevent contamination.

Additional Lubrication Points and Tips

Chuck and Tool Holders: Occasionally lubricate

to prevent rust; use light oil or rust inhibitors. Tailstock Quill and Bearings: Keep these components properly lubricated to ensure smooth movement. Electrical and Hydraulic Components: Avoid direct lubrication; keep clean and inspect for leaks or damage.

Maintenance Schedule and Best Practices

Frequency	Tasks
Daily	Wipe down exposed surfaces, check oil levels, apply light oil to ways and sliding surfaces.
Weekly	Inspect and clean lubrication points, apply fresh lubricant as needed.
Monthly	Change gearbox and spindle oils, inspect for wear or damage.
Annually	Complete thorough inspection, replace worn parts, and perform full lubrication overhaul.

Best practices for lubrication include: Using only recommended lubricants specified in the Nardini 1440 manual. Keeping all lubrication tools clean to prevent contamination. Applying lubricants evenly and avoiding excess, which can attract dirt. Monitoring for leaks or signs of wear and addressing issues promptly.

Conclusion

Understanding and properly maintaining the lubrication points on a Nardini 1440 lathe is essential for ensuring machine longevity, safety, and machining precision. Regular inspections, correct lubricant application, and adherence to the maintenance schedule will keep your lathe operating at peak performance. Whether you're performing routine daily checks or comprehensive annual maintenance, paying close attention to these lubrication points will help you avoid costly repairs and maintain the high standards expected from this precision machine. Proper lubrication isn't just routine maintenance; it's a critical component of professional machining excellence.

Question Answer

What are the main lubrication points on a Nardini 1440 lathe?

The main lubrication points include the headstock bearings, carriage slideways, tailstock, lead screw, and gearbox gears to ensure smooth operation and prevent wear.

How often should I lubricate the Nardini 1440 lathe's moving parts?

Lubrication should be performed regularly, typically after every 8-10 hours of use or once a week, depending on workload and operating conditions.

What type of lubricant is recommended for the Nardini 1440 lathe's lubrication points?

Use high-quality machine oil or way oil specifically designed for machine tools, as recommended by the manufacturer, to ensure proper lubrication and protection.

Are there any specific lubrication procedures for the Nardini 1440 lathe's gearbox?

Yes, the gearbox requires periodic oil changes using the recommended gear oil, and it's important to

check oil levels regularly and top up as needed.

How can I identify worn or insufficient lubrication points on the Nardini 1440 lathe?

Signs include unusual noise, increased friction, or difficulty moving parts. Regular inspection and lubrication help prevent these issues; if parts appear dry or show signs of wear, re-lubricate or replace them.

Is there a recommended maintenance schedule for lubrication on the Nardini 1440 lathe?

Yes, follow the manufacturer's maintenance schedule, which typically includes daily, weekly, and monthly lubrication tasks to keep the lathe running efficiently and prolong its lifespan.
