Multiple Choice QuestionQ: Which of the following best describes the primary function of an airplane's wing?A) To generate thrustB) To produce liftC) To control directionD) To store fuelAnswer: B) To produce lift

Short Answer QuestionQ: Explain the role of the tail fin in an aircraft's stability and control.A: The tail fin, or vertical stabilizer, helps maintain the aircraft's directional stability by preventing unwanted yawing movements. It also provides a surface for the rudder, which the pilot uses to control yaw and steer the aircraft left or right during flight.

Diagram/Illustration QuestionQ: Given a sketch of an airfoil, identify the parts responsible for generating lift and describe how their shape contributes to this function.A: The upper surface of the airfoil is curved (cambered), and the shape causes faster airflow over the top, reducing pressure according to Bernoulli's Principle. The difference in pressure between the top and bottom surfaces generates lift, enabling the aircraft to stay airborne.

Common Questions and Sample Answers in PLTW Unit 3

Below are typical questions students might encounter, along with detailed explanations and sample answers to clarify the reasoning process.

Question 1: Calculating Gear Ratios

If a gear train has a gear A with 20 teeth and gear B with 60 teeth, what is the gear ratio? How does this ratio affect the output speed?

Answer: Gear ratio = Number of teeth on driven gear / Number of teeth on driver gear = $60 / 20 = 3:1$.

Effect on speed: The gear ratio of 3:1 means that for every 3 rotations of gear A (driver), gear B (driven) completes 1 rotation. **Implication:** The output speed decreases by a factor of 3, but torque increases proportionally. Understanding this helps students see how gear

ratios influence the trade-off between speed and torque in mechanical systems.

Question 2: Mechanical Advantage of a Lever
A lever is used to lift a 200 N weight. The effort applied at the other end of the lever is 50 N. What is the mechanical advantage of the lever?
Answer: Mechanical advantage (MA) = Load force / Effort force = 200 N / 50 N = 4.
Interpretation: The lever multiplies input force by a factor of 4, making it easier to lift heavy loads with less effort. This reinforces the concept that simple machines like levers provide mechanical advantage, reducing the effort needed to perform work.

Question 3: Identifying the Type of Mechanism
Given a diagram of a linkage that converts rotary motion into oscillating motion, identify the type of mechanism.
Answer: Likely a four-bar linkage or oscillating crank, depending on specific linkages.
Explanation: Four-bar linkages are common in converting rotary motion into linear or oscillating motion, used in various mechanical devices like windshield wipers or pistons. Students should analyze the linkage diagram to identify pivot points, link lengths, and the motion path.

Question 4: Calculating Power in a Mechanical System
A motor applies a force of 50 N to move a mechanism at a velocity of 2 m/s. What is the power output?
Answer: Power (P) = Force (F) × Velocity (v) = 50 N × 2 m/s = 100 Watts.
Significance: Power measures how quickly work is done; understanding this helps evaluate system efficiency.

Tips for Using Test Answers Effectively
Use answers as a learning tool: Review explanations to deepen understanding. Cross-reference with class notes and textbooks to clarify misconceptions. Practice similar problems to reinforce concepts and improve problem-solving speed. Seek feedback from teachers or peers to ensure comprehension.

Sample Fluid Power Practice Problems with Answers

Problem 1: Hydraulic Force Calculation

Given: A hydraulic cylinder has a piston diameter of 4 inches. The system operates at a pressure of 1500 psi.

Question: What is the force exerted by the cylinder?

Solution:

Convert diameter to radius: $\text{Radius (r)} = 4 \text{ inches} / 2 = 2 \text{ inches}$

Calculate the area (A): $(A = \pi r^2 = \pi \times (2)^2 = 12.57 \text{ in}^2)$

Use the formula for force: $(F = P \times A)$

Convert pressure to psi (pounds per square inch): $(F = 1500 \text{ psi} \times 12.57 \text{ in}^2 = 18,855 \text{ lbs})$

Answer: The hydraulic cylinder exerts approximately 18,855 pounds of

force. Problem 2: Flow Rate in Pneumatic System Given: A pneumatic system has a compressor delivering air at a pressure of 100 psi and a flow rate of 10 CFM (cubic feet per minute). Question: How much air volume flows through the system per minute? Solution: Since flow rate is directly given: Flow rate = 10 CFM Answer: The system delivers 10 cubic feet of air per minute.

Problem 3: System Efficiency Given: A hydraulic system consumes 200 Watts of power but produces a useful work output of 150 Watts. Question: What is the efficiency of the system? Solution: Efficiency (η) is calculated as: $\eta = \frac{\text{Useful Power Output}}{\text{Power Input}} \times 100$ ($\eta = \frac{150}{200} \times 100 = 75\%$) Answer: The system has an efficiency of 75%.
